

In addition to your python code, your submission should include a readme.pdf file that describes **how to run/use your program** and any **additional data files needed** to run your program. The readme file should also include a discussion of **how you broke down the problem**. What was the **high-level objective** of your program, what **subproblems** did you need to solve, and what your **general approach** was. You should feel free to include figures in your readme if they will help with the discussion.

How to run/use: download all files to same directory, run adventure.py file

Files needed: graphicsfunctions.py, 13 txt files (graphics), gamePlay.py, builder.py, adventure.py

How we broke down problem:

High level objective: Our objective was to create an adventure game that the user can interact with. We knew we wanted the user to be able to choose their own adventure and have lots of variety in potential storylines.

Subproblems: The main problem we encountered was how to structure the game in the sense of getting from event to event and storing information from those events. We decided to make two main python files. The driver, adventure.py, has the player class and imports the other main file, gamePlay.py. Adventure calls functions from gamePlay and passes a player object in between the two files. We also had to decide how to display our graphics. We took Danielle's advice and made functions that would call the graphics from text files. Our last major subproblem was the timing; our text was printing all at once, so we had to go through and add time.sleep() commands throughout the dialogue.

General approach: We started by planning out our storyline (see image) and breaking it down into smaller sections to code. Our code generally follows the storyline and dialogue we laid out. We also established early on what separate files we would need, which helped us keep things organized and allowed us to multitask. Here is our general approach to those files:

Gameplay file: where the actual gameplay happens, structure: establishing answer keys and input checks, events and dialogue contained in functions that call on each other in order to continue the storyline

Adventure file: driver, contains player class, structure: code for player stats, start and end of game

Builder file: used for character select, assigning strengths/weaknesses

Graphics file: contains all functions that call graphics from text files (each graphic is also contained in its own text file)
